TEAM 4 / TEAM GALAXY / CET257

# Final zero-budget marketing plan

Final strategy and evidence of implementation. Prepared 13 October 2026; future targets are distinguished from completed activities.

## 1. Business, audience and purpose

Team Galaxy is a four-person student software team developing digital solutions for warehouse safety learning. Its flagship project, Team Galaxy Safety, is a browser-based academic prototype with six topics, interactive 360-degree hotspot lessons, assessments and learning records. The promotional website presents the company, demonstrated capabilities, product and people to prospective clients.

The primary audience is warehouse and logistics managers, safety personnel and training coordinators. Supervisors and trainees are secondary audiences. Their practical needs include understandable learning, controlled access, organised training assignments and visible progress.

## 2. Positioning and message

**Organise Warehouse Safety Training in One Place.** The website explains how the product supports this through workplace scenes, varied practice and saved records. It describes implemented features without claiming that the prototype is accredited or that it has reduced workplace incidents.

Corporate identity uses the existing Team Galaxy planet logo, blue accents, light backgrounds and readable typography. The mission is to design digital solutions that support warehouse safety training. Clarity, reliable software and teamwork guide the content.

## 3. Marketing objectives

• Publish a separate company website that explains Team Galaxy, its capabilities and all four members. This objective was completed on 13 October 2026.

• Give interested users a clear route from the promotional site to the existing hosted training prototype. Training still requires an administrator-provided account.

• Over the next four weeks, aim for five relevant people to view the project, three structured feedback responses and one follow-up demonstration. These are future targets, not recorded achievements.

Render static hosting is subject to included bandwidth and build limits. Monitor these allowances, keep assets lightweight and avoid paid upgrades or a purchased domain under this plan.

# Channels and resources

Use existing work, free hosting and direct relationships. No paid advertising, purchased audience lists or custom domain are included.

## 4. Zero-budget channel strategy

**Public website:** Render hosts a separate static site at https://team-galaxy-website.onrender.com. Home introduces our services; Product explains the platform; Team presents the members; Contact provides enquiry links; Marketing in Practice shows published examples and links to this plan.

**Public project repository:** https://github.com/anuragdahal2025/team-galaxy-website provides the website source, operating instructions and a public issue route. This gives technically interested visitors a way to inspect the project and ask questions. It is not evidence of any particular audience size.

**Demonstrations and existing materials:** Use the already prepared presentation, logo and product materials when showing the project. The published interactive illustration explains hotspot learning without exposing trainee records or account credentials.

**Permission-based outreach:** Team members can share the website through appropriate university or professional channels and their own profiles. Any messages or posts should be sent by authorised team members, remain relevant to the audience and be recorded after publication. No new outreach messages were sent during this website build.

## 5. Budget and responsibilities

| Resource | Approach | Additional spend |
|---|---|---|
| Hosting and address | Render Static Site and its onrender.com address | No paid hosting plan selected |
| Source control | Existing GitHub account; separate repository | No paid repository service |
| Website assets | Existing logo, original illustration and locally hosted open-source fonts | No stock image or font purchase |
| Promotion | Existing materials and suitable direct/professional channels | No paid adverts or printing |

Anurag Dahal coordinates the work and checks the claims; Prajwal Gurung leads visual design and marketing; Sudip Bastola supports implementation and deployment; Nischal Nepal organises copy, records and feedback. Team time, equipment and internet still have a resource cost even where additional cash spend is zero.

# What was put into practice

Evidence records actions that happened. Publication, reach and feedback are separate measures.

## 6. Completed activity and evidence

| Activity | Recorded result | Evidence in submission |
|---|---|---|
| Create a separate promotional site | Five public pages including marketing-in-practice examples | Website source ZIP; design documentation |
| Publish the site on Render | Static Site live on 13 October 2026; separate from training app | B2_Website_URL.txt; Render Live screenshot |
| Publish source on GitHub | Separate public repository connected to the Render site | Repository URL; source archive |
| Apply corporate identity | Logo, mission, values, blue/light styling and consistent page navigation | Corporate Identity PDF; company screenshot |
| Explain product to visitors | Six topics, role-based workspace and learning journey; labelled illustrative hotspot preview | Product page screenshots |
| Provide a feedback route | Public GitHub issue link on Contact page | Contact page screenshot |

The website was checked in Chrome at desktop width and at a 390-pixel phone viewport. All five public pages had no horizontal overflow; local links and assets were checked; the mobile navigation and illustrative hotspot interaction were exercised. These are website checks, not claims that the training application has been tested on every browser.

No visitor totals, conversion rates, enquiries or new feedback responses have been verified for this launch. Previous presentations and client feedback can be used as additional marketing evidence only when their original records are attached. Prepared materials do not establish distribution or engagement by themselves.

# Evaluation and next actions

Keep the final strategy useful after launch by recording real audience responses and decisions.

## 7. Evaluation and feedback process

Maintain a simple log containing date, channel, material shared, audience, link or screenshot, response and follow-up. Record voluntary feedback in a structured form: what was understood, what was unclear and what the visitor wanted to explore next. Avoid collecting personal information that is unnecessary for project evaluation.

Evaluate the plan by relevance and understanding, not only likes or page views. Compare genuine demonstration requests and useful feedback with the future targets. If no analytics are configured, do not estimate visitor totals. A screenshot of a public post proves publication; an enquiry or completed feedback record proves response.

## 8. Four-week follow-up plan

• Week 1: verify the public URL and promotional links, prepare a short approved launch message and share it through appropriate channels. Keep evidence of actual publication.

• Week 2: demonstrate the learning journey to relevant contacts and invite focused feedback. Record the context and observations.

• Week 3: follow up with interested contacts, clarify misunderstood features and refine copy where necessary.

• Week 4: review actual views or responses that can be evidenced, assess progress against the targets and record recommendations.

## 9. Professional boundaries

Use demo information only in public materials. Do not publish database connection strings, encryption keys, passwords or private trainee records. Explain that the product is an academic prototype and that its completion records are not accredited qualifications. Public GitHub enquiries require sign-in and are visible to others; private concerns should be raised through an agreed project communication channel.
